Event Registration

Name: Supriya TR

Roll No: 241401111

241401111

Building Reports, Dashboards, and Custom Pages (UI Builder)

Event Registration Form

1. Aim

To build supporting Reports and a UI Builder Dashboard Page for the existing “Event Registration Form” application in Zoho Creator, allowing an event coordinator to view, filter, and triage submitted participant registrations, and allowing registration status and track-wise trends to be monitored from a single unified screen.

2. Procedure

2.1 Building the Reports

1. Open Reports in the left sidebar; Zoho Creator auto-generates a grid report from the form. Rename it “All Event Registrations”, listing participant name, email address, institution address, contact number, college / organization name, and expectations from event for every registration.

2. Create a second report, group it by the Track field, and name it “Event Kanban” so registrations are organized into Artificial Intelligence & Machine Learning, Web & Mobile Development, Cloud Infrastructure & DevOps, Cybersecurity & Privacy, and Product Management & UX/UI Design columns, making it easy to see which tracks are drawing the most registrations.

3. Create a third report, “Event list”, that consolidates participant name, email address, institution address, contact number, college / organization name, and expectations from event into a single scrollable table for the organizing committee to review at a glance.

2.2 Building the Dashboard Page (UI Builder)

1. Go to Pages under UI Builder → click New Page → choose Blank Page → name it “Dashboard.”

2. Add a summary tile showing the count of new registrations received this month, so the coordinator can gauge overall turnout at a glance.

3. Add status cards for each track — Artificial Intelligence & Machine Learning, Web & Mobile Development, and Product Management & UX/UI Design — each linked to a count of the matching registrations, so track-wise order status is visible immediately.

4. Add a Chart Component plotting Total Records against each track, to visualize which tracks are generating the most participant interest.

5. Drag in a button linking to the “All Event Registrations” report so every registration can be opened directly from the dashboard.

6. Arrange the layout top to bottom: summary tile → track-wise status cards → registrations-by-track chart → link to all registrations.

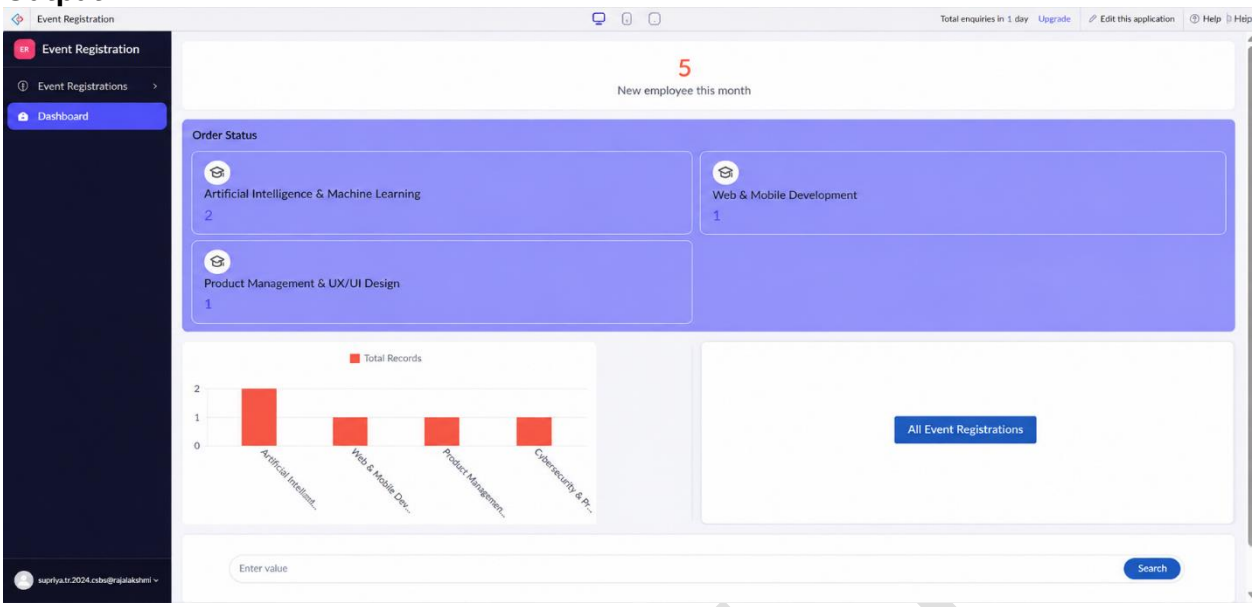

7. Preview the page to confirm the summary loads with the correct counts, the chart renders correctly, and each report link opens the right view.

8. Check Form, Report, and Page permissions under Settings for each user role, ensuring the intended roles have View/Add access.

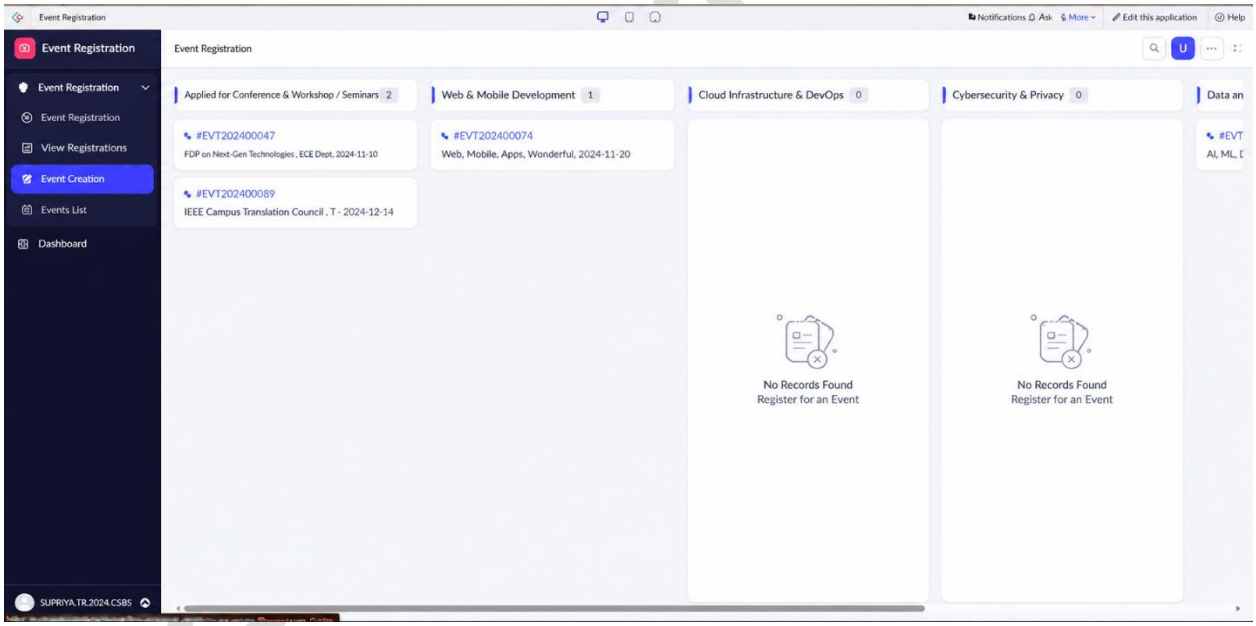

9. Publish the page and, if required, set “Dashboard” as the default landing page under App Settings → Pages.

3. Output

4. 

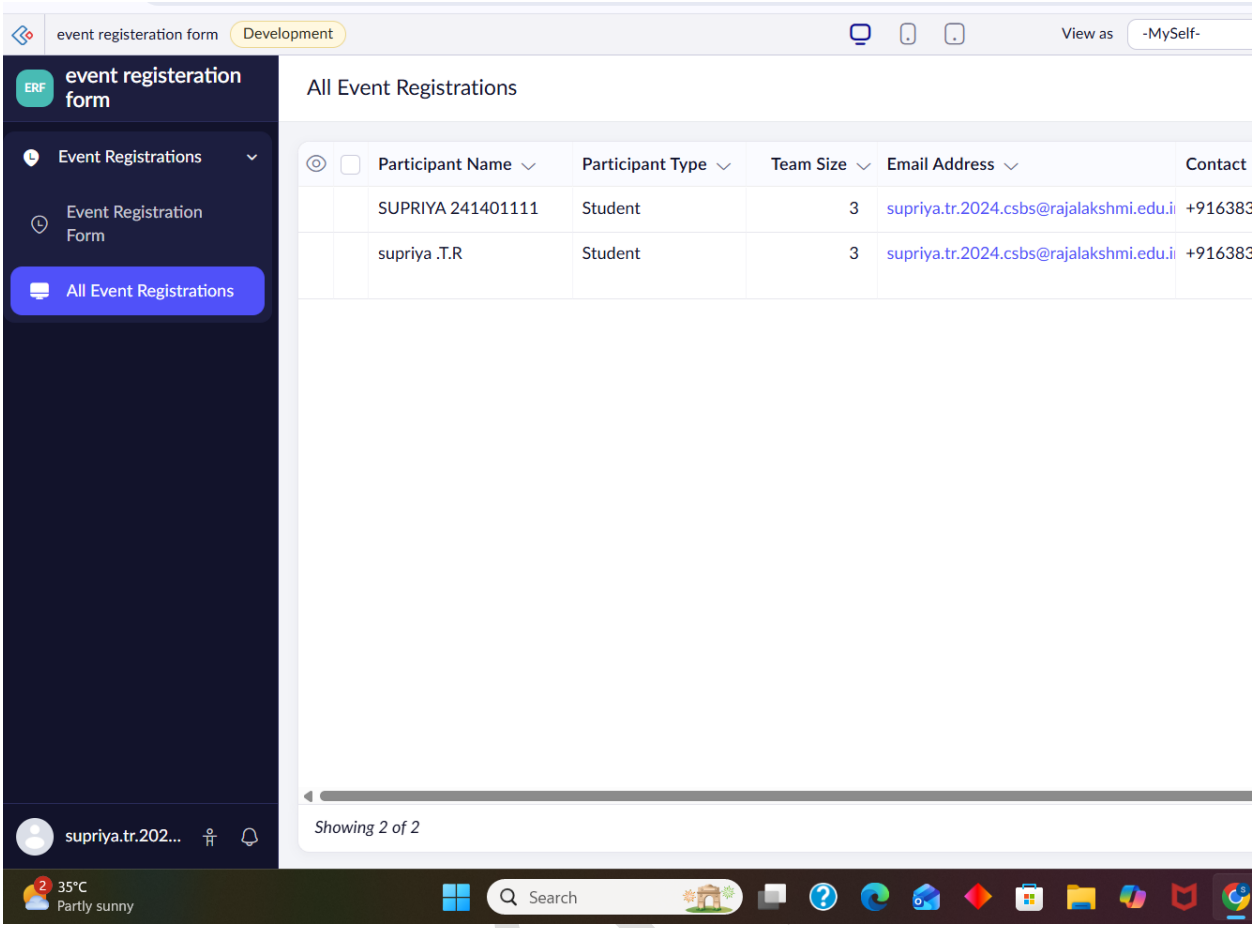

Dashboard – new registrations summary, track-wise order status, and total records chart

Event Kanban – registrations grouped by Artificial Intelligence & Machine Learning, Web & Mobile Development, Cloud Infrastructure & DevOps, Cybersecurity & Privacy, and Product Management & UX/UI Design

The Dashboard gives the organizing committee an at-a-glance view of turnout: the summary tile shows five new registrations for the month, the track-wise status cards break that number down into Artificial Intelligence & Machine Learning (2), Web & Mobile Development (1), and Product Management & UX/UI Design (1), and the Total Records chart plots the same counts visually so the busiest tracks stand out immediately without opening a single report.

The Event Kanban view takes the same Track grouping and turns it into draggable columns, with each card showing the participant's contact number and address. Cloud Infrastructure & DevOps and Cybersecurity & Privacy currently show no records, which tells the committee those tracks may need additional promotion before the registration window closes, while Artificial Intelligence & Machine Learning is clearly the most popular choice so far.

Event list – consolidated view of participant, institution, and expectation details for every registration

The Event list report brings together every field captured on the registration form — participant name, email address, institution address, contact number, college or organization name, and expectations from event — into a single scrollable table. This gives the organizing committee a quick way to review who has registered, cross-check contact details before sending confirmations, and read each participant's expectations so sessions and mentors can be matched to interest areas ahead of the event.

4.1 Fields Captured on the Registration Form

Field	Purpose
Participant_Name	Identifies the registrant on every report and card.
Email_Address	Used to send confirmations and event updates.
Institution_Address	Location of the participant's college or workplace.
Contact_Number	Direct phone contact for last-minute coordination.
College_Organization_Name	Groups participants by institution for outreach.
Expectations_From_Event	Helps match sessions and mentors to interests.
Track	Drives the Event Kanban grouping and dashboard status cards.

5. Result

An “All Event Registrations” report, an “Event Kanban” report grouped by track, and an “Event list” report were built alongside a consolidated “Dashboard” page using UI Builder for the existing Event Registration Form application. This enables the organizing committee to view registration patterns at a glance, track order status by track, and review every registration from a single unified screen, ensuring each participant registration is captured as a structured, trackable digital record before session allocation and event day check-in.

6. Learning Outcome

Through this exercise, the process of extending a Zoho Creator form-based application with reporting and dashboarding capabilities was learned in a practical, hands-on manner. Key takeaways include renaming and customizing auto-generated grid reports so they surface the fields that matter most to an end user, grouping a report by a picklist field (Track) to obtain an instant Kanban view without any custom scripting, and composing a UI Builder page out of reusable components — summary tiles, status cards, charts, and embedded reports — to produce a single-screen operational dashboard.

The exercise also reinforced the importance of verifying role-based permissions for every Form, Report, and Page before publishing, since a dashboard is only useful if the intended audience — in this case the event organizing committee — actually has View and Add access to the underlying data. Finally, previewing the published page confirmed that counts on the Dashboard, the Event Kanban columns, and the Event list report all stayed in sync, which validated that the reports were correctly built on top of the same Event Registration form rather than a disconnected copy of the data.

7. Conclusion

This experiment successfully demonstrates how Zoho Creator's Reports module and UI Builder can be combined to transform a simple registration form into a fully functional event management tool. With the All Event Registrations, Event Kanban, and Event list reports feeding a single consolidated Dashboard, an event organizing committee can monitor participation trends, spot under-subscribed tracks early, and manage the entire registration lifecycle — from initial sign-up through to session planning — without needing any additional software or manual spreadsheet consolidation.

8. Sample Registration Snapshot

The table below lists the five participants captured in the Event list report at the time of testing, confirming that every registration flows through cleanly from the form into the reports and the Dashboard.

Participant	College / Organization	Contact Number
SUPRIYA	Rajalakshmi Engineering college	+91 6383518440
THARIKA	Carnegie	+91 9360719842
SHARMILA	rajalakshmi engineering college	+91 9677021276
TEJINI	REC	+91 6374184211
MEIYANBAN	Rajalakshmi Engineering college	+91 8838616012

As more participants register, the same five records shown here will keep growing in the All Event Registrations, Event Kanban, and Event list reports simultaneously, and the Dashboard's summary tile, status cards, and chart will update automatically without any manual refresh, since every component is bound live to the underlying Event Registration form.
