Experiment 9

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

---

Name: SUPRIYA TR | Roll No: 241401111

Title

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator – Event Registration Application.

Aim

To explore the built-in analytics and interactive dashboard components of the Event Registration application in Zoho Creator, and to check the availability of AI-assisted (Zia) features in the application and its editor.

Objective

- To observe the KPI card, summary cards, chart and buttons displayed on the application dashboard.
- To study the interactive behaviour of the column chart.
- To study how the same dashboard is arranged in the Design area of the application editor.
- To check the Design area of the application editor for Zia / AI-assisted options.

Software / Tools Required

- Zoho Creator (web-based low-code application development platform)
- Event Registration application created in Zoho Creator
- Web browser with an active internet connection
- Zoho account with access to the application and its editor

Introduction / Theory

AI-Assisted Features in Zoho Creator

AI-assisted features in a low-code platform are intended to help users build applications and understand their data with less manual effort. At a conceptual level, such features may assist with tasks such as generating insights from stored data, answering questions about data, or suggesting elements of an application. The availability of these features depends on the Zoho Creator edition, the plan of the account and the interface version in use.

Zia

Zia is the artificial-intelligence assistant of the Zoho ecosystem. Conceptually, Zia provides AI-driven capabilities, such as data insights and assistance in working with application data, within Zoho products. Whether and where Zia options appear in Zoho Creator depends on the account and plan.

Built-in Analytics and Dashboards

Zoho Creator provides built-in analytics through pages and dashboards, which present application data visually without external tools. A dashboard combines several components on one page so that the status of the application can be understood at a glance. The following components are commonly used:

241401111

Component	Purpose
KPI cards	Display a single key figure, such as a total or a count of records.
Summary cards	Show the count of records for each category or status, as a group of small cards.
Charts	Represent data graphically, for example column charts for comparison between categories.
Buttons and search	Provide quick navigation to a report, and a search box to look up records.
Interactive visualizations	Respond to user actions such as hovering, which displays the exact value represented by a chart bar.

Procedure

1. Open Zoho Creator and sign in. The home page lists the available applications.
2. Open the Event Registration application and select Access this application to open it in its live (application) view.
3. Observe the dashboard. It contains a KPI card, an Order Status section with summary cards, a column chart, an All Event Registrations button and a search bar.

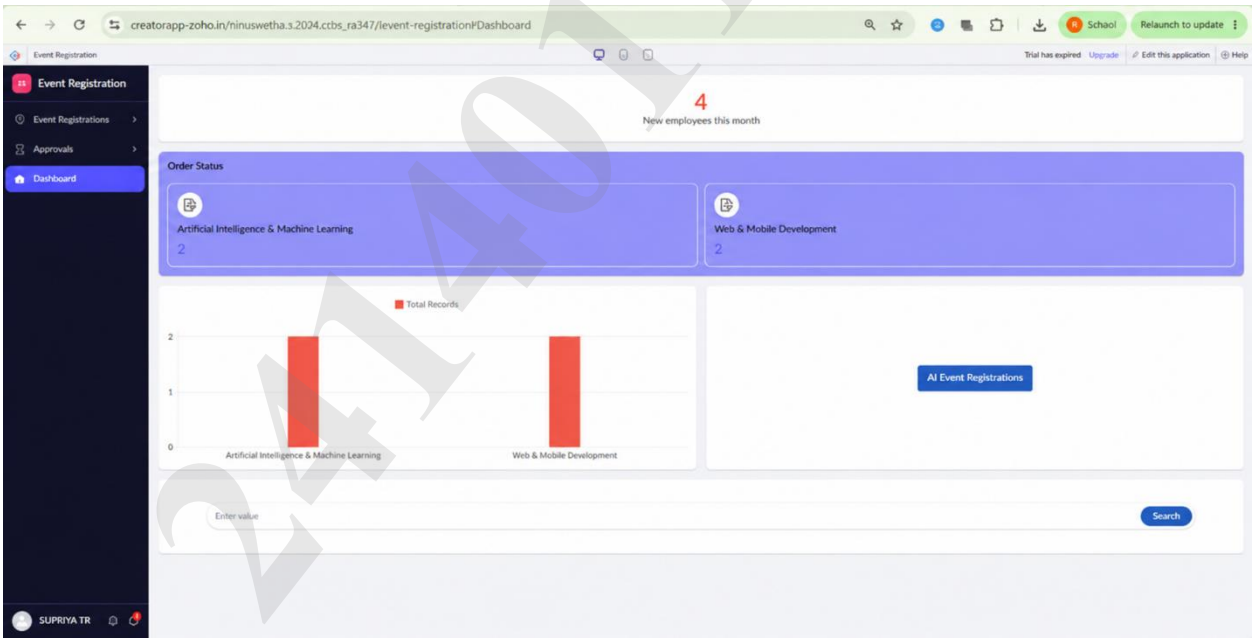

Figure 9.1: Event Registration Dashboard with Built-in Analytics

4. Examine the KPI card at the top of the dashboard. It displays the value 4 with the label "New employees this month".
5. Examine the Order Status section. It has two summary cards: Artificial Intelligence & Machine Learning – 2 and Web & Mobile Development – 2.
6. Examine the column chart. Its legend shows Total Records, and it has one bar for each of the two categories (Artificial Intelligence & Machine Learning and Web & Mobile Development). The vertical axis ranges from 0 to 2.
7. Place the pointer over the first bar of the column chart. A tooltip is displayed showing Total Records – Artificial Intelligence & Machine Learning : 2.

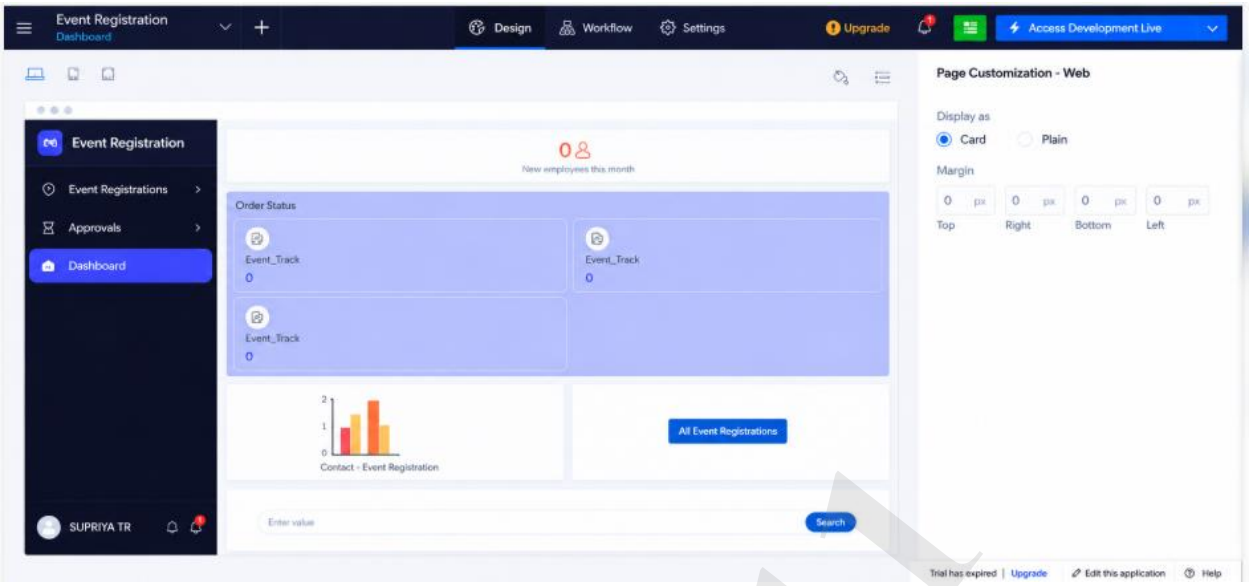

Figure 9.2: Interactive Column Chart Showing Total Records

8. Note the All Event Registrations button and the search bar (with the Search button) at the bottom of the dashboard. They are used for navigation and for looking up records.
9. Select Edit this application to open the application editor, and check the Design area for any Zia, Analytics or AI-specific option.

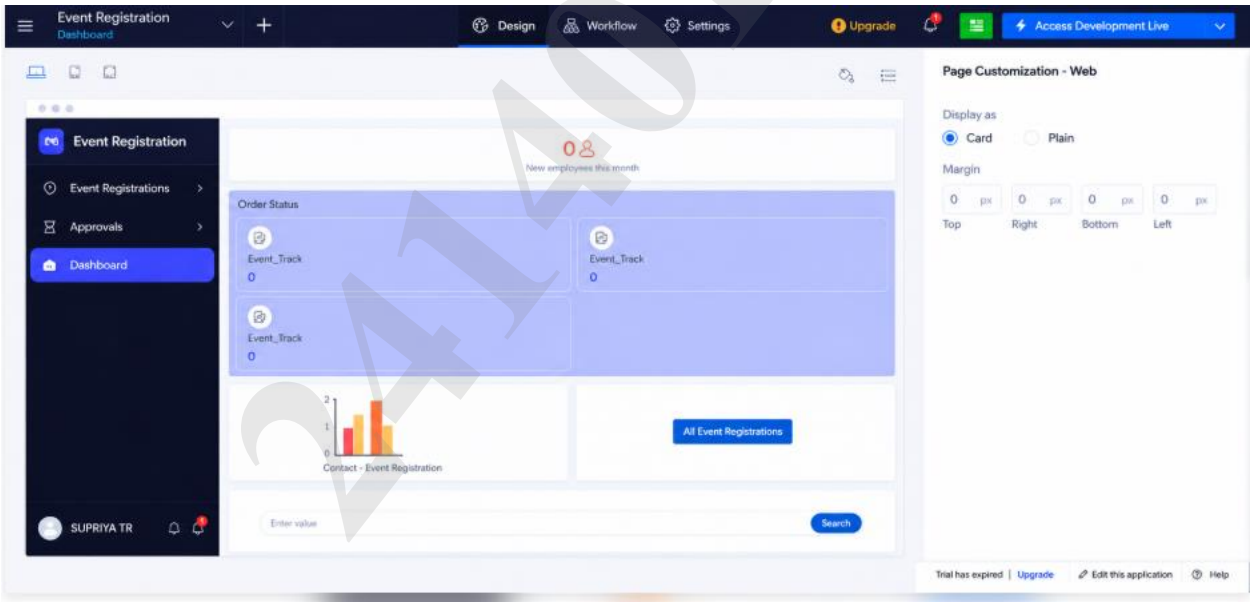

Figure 9.3: Zoho Creator Application Editor – Design Area

10. Observe the Design area. The dashboard components are shown as placeholders, and the Page Customization – Web panel offers only display and margin settings. No Zia or AI-specific option is visible.
11. Note that the account displays “Trial has expired” with an Upgrade option, and record that Zia / AI-assisted functionality was not available in the current account / interface.

Dashboard Analytics

The dashboard components displayed the following values in the live view:

Component	Label	Value
KPI card	New employees this month	4
Summary card	Artificial Intelligence & Machine Learning	2
Summary card	Web & Mobile Development	2

The two summary card values add up to 4, which matches the figure shown in the column chart (two bars of height 2). The dashboard also contains the All Event Registrations button and a search bar with a Search button.

Interactive Chart Analysis

The column chart on the dashboard responds to the pointer and displays the exact value on hovering.

Chart	Hover Result	Interpretation
Column chart (Total Records)	Total Records – Artificial Intelligence & Machine Learning : 2	Two event registrations belong to the Artificial Intelligence & Machine Learning category.

This shows that the dashboard chart provides interactive data details: the exact count behind a bar can be read directly from the chart instead of being estimated visually.

Design Area Observation

The Design area of the editor (Figure 9.3) shows the same dashboard in an editable layout. The values are replaced by placeholders, as listed below.

Element in the Design area	Observation
KPI card	Shown as Ct () with the label "New employees this month"; Ct () stands in for the record count shown in the live view.
Order Status section	Three card placeholders labelled Event_Track, each with Ct (); the live view displayed two cards with category names and counts.
Chart	Shown as a column chart icon named "Column – Event Registration".
Button and search bar	The All Event Registrations button and the search bar with the Search button are present.
Page Customization – Web panel	Display as: Card (selected) or Plain; Margin: Top 0, Right 0, Bottom 0, Left 0 (px).

Zia / AI-Assisted Feature Exploration

The application and its editor were checked for Zia / AI-assisted functionality:

- Design area: inspected through the application editor (Figure 9.3). No Zia, Analytics or AI-specific option was visible.
- Account status: the account displayed "Trial has expired" with an Upgrade option.

Therefore, Zia / AI-assisted functionality was not available in the current account / interface. Zia was not used, configured or demonstrated in this experiment, and no AI-generated insights were obtained. The analytics demonstrated in this experiment are the built-in dashboard features of the application.

Result

The following were successfully carried out in the Event Registration application:

- The dashboard KPI value (New employees this month – 4) and the Order Status values (Artificial Intelligence & Machine Learning – 2, Web & Mobile Development – 2) were observed.
- The interactive column chart (Total Records – Artificial Intelligence & Machine Learning : 2) was explored.
- The Design area of the editor was inspected and its dashboard placeholders and page settings were identified.

The Design area was checked for Zia / AI-assisted features; however, no such option was available in the current account / interface because the trial had expired. Hence, Zia was not used in this experiment.

Conclusion

The experiment demonstrated the built-in analytics of Zoho Creator through the Event Registration application. The KPI card and summary cards present key figures, the interactive column chart reveals exact values on hovering, and the Design area shows how these components are arranged and customised. These features help in monitoring event registrations without external analytical tools. The Zia / AI-assisted functionality could not be explored because it was not available in the current account / interface, where the trial had expired. The practical work therefore covered the built-in dashboard analytics and the interactive chart.
